DOCTOR SPACE

Crew Health Center

A magnetic-pad ultrasound guide that lets a crew member who is not a doctor check the heart and belly, read the result, and know the next step.

Wearable magnetic ultrasound

Magnets hold the probe in the right place. The crew member does not have to find it by feel.

- **The gap.** On a long mission a doctor may be days from Earth, and a doctor may not be on board at all.
- **Sticker pads.** A printed sheet of anatomical pads goes on the skin. Each pad has a window for the probe and a few steel dots.
- **Magnetic collar.** Small magnets in a collar on the probe dock to the steel dots. They hold position and angle, not pressure.
- **Same spot every time.** Pads stay on, so today's image can be compared with the last one.
- **Low cost to try.** Printed sheet, steel dots, small magnets. A first prototype fits on a table.

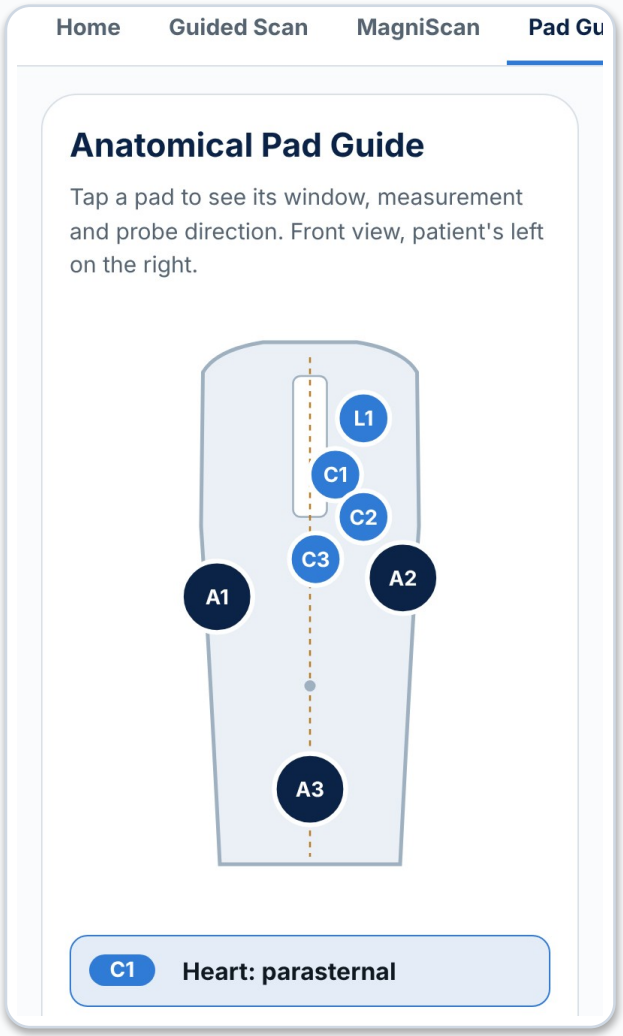

MagniScan hold model: gap, force and field at skin, with a safety factor shown.

Concept prototype. Simulated data and illustrations. Not a validated medical device.

Where the probe goes

Seven pads cover the heart, lung and belly. Each one has a landmark that anyone can find.

C1 / C2 / C3	Heart: beside the breastbone, under the left nipple line, and just under the breastbone.
L1	Lung: between the ribs, just below the collarbone. Sliding is normal.
A1 / A2	Belly: right and left flank, for liver, kidney and spleen.
A3	Pelvis: just above the pubic bone, for the bladder.

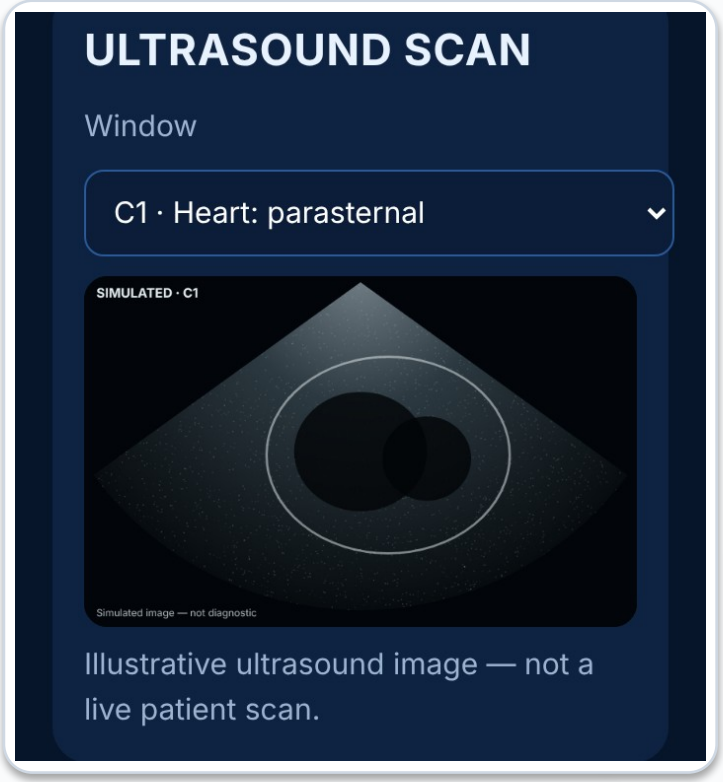

How a crew member places a pad

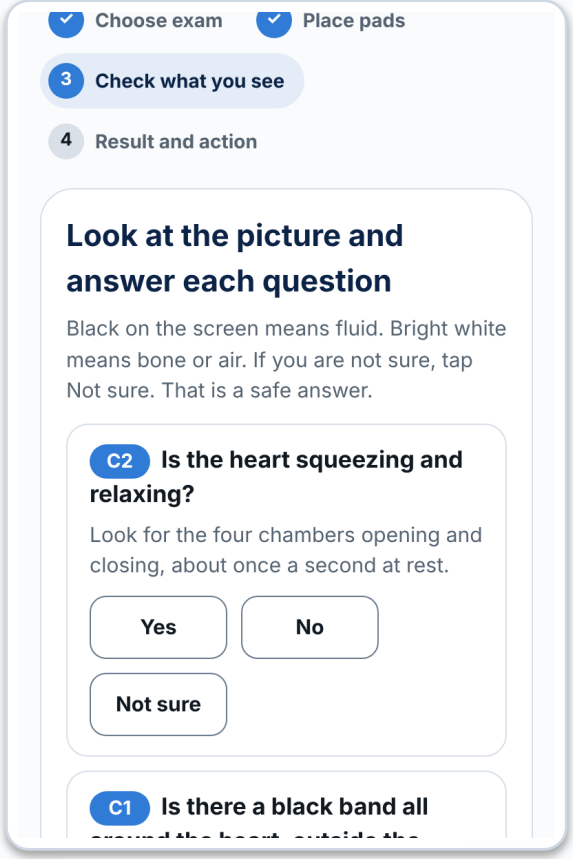

1 Measure from the notch at the base of the throat. 2 Mark the spot. 3 Stick the pad and turn the arrow toward the head. 4 Dock the probe collar. 5 The app shows the pad on screen and asks what you see.

Sample positions for an average adult. A trained sonographer should confirm each window before real use.

Ultrasound simulation

Crew can practise on the ground and in flight. The picture and the questions are the same.

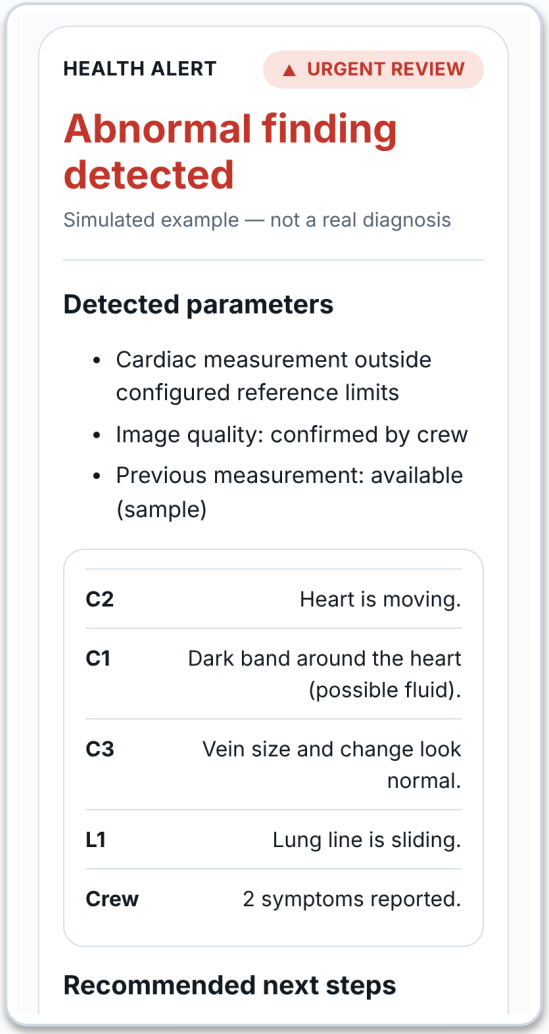

- **Pick a window.** Heart, lung or belly pad.
- **Look at the picture.** Black is fluid. Bright is bone or air.
- **Answer in plain words.** Yes, No or Not sure. Not sure is treated as a concern.
- **Flip a frame.** Capture and add it to the report.

Every image is labelled simulated. The questions follow the same four-view order a trained operator would use: heart motion, fluid around the heart, vein size, lung sliding.

Concept prototype. Simulated data and illustrations. Not a validated medical device.

HEALTH ALERT

The app turns the answers into one clear result: normal, review, or urgent.

NORMAL All four views look normal and no symptoms.

REVIEW One concern, one “not sure”, or a symptom. Send to the flight surgeon.

URGENT No heart movement, two or more findings, or a finding plus a symptom.

What the crew member sees

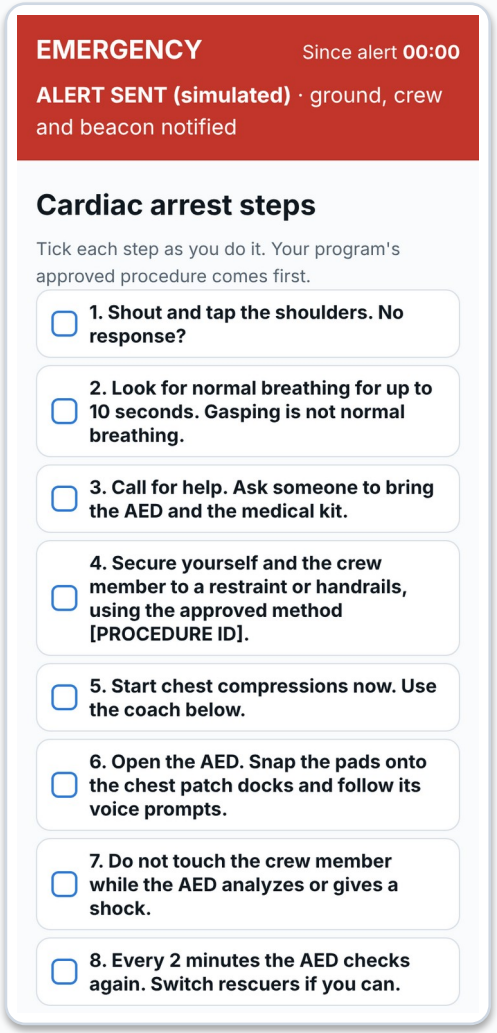

- The result, with each pad and what was seen at it
- Recommended next steps in order
- A button to send the report and alert to the flight surgeon
- The locked medical kit, only if the result is urgent

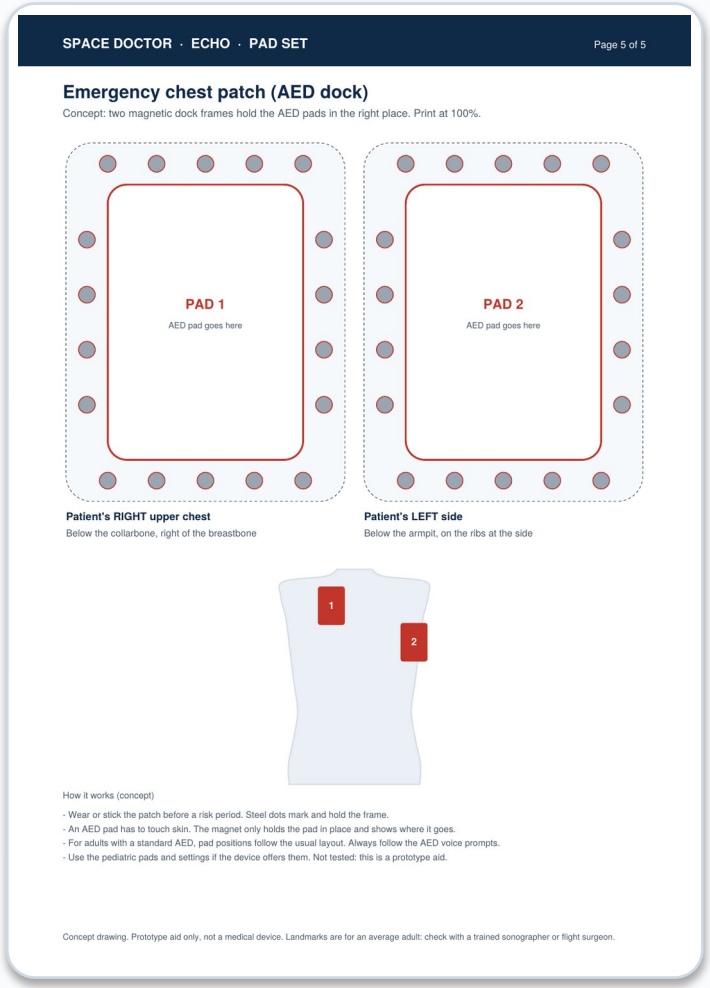

The app never chooses a drug or a dose. The ground team gives the order.

Concept prototype. Simulated data and illustrations. Not a validated medical device.

Guidance for the astronaut

One button for a collapse. Plain steps for someone who has never done it.

- **SOS button.** Always on screen. 10 seconds to cancel, then ground and crew are alerted.
- **CPR coach.** Checklist, then a compression coach: about 100 to 120 per minute, 5 to 6 cm deep, with microgravity methods.
- **AED chest patch.** Two magnetic frames hold the AED pads at the right chest positions. Snap the pads in and follow the voice.
- **Locked kit.** Opens only after a second person authorises it and a five-item check is ticked.
- **Wellness vitals.** Compares heart rate, temperature and blood pressure with the astronaut's own baseline, not an Earth average.

Concept prototype. Simulated data and illustrations. Not a validated medical device.

Thank you

Doctor Space gives a crew member without medical training a way to look, understand, and act.

Impact

- Space: a health backup for crews far from Earth
- Earth: remote clinics and first responders can use the same pad guide
- Free, offline, runs in any browser
- Next: test with a sonographer, then with real crew data

How NASA resources made it possible

- NASA Human Research Program: five hazards of spaceflight shaped the scope (distance, isolation, closed environment)
- NASA / ISS studies on ultrasound, body temperature and heart rate set the baseline idea
- [NASA DATASET USED] feeds the CSV import
